[NAME OF DOCUMENT] ABSTRACT

[Abstract]

[Object] It is an object to scheme improvement of communication quality upon enhancing resistibility to a burst error in a propagation path.

[Overcoming Means] A first repetition section 103 increases the number of bits of data about roughly half the number of bits among the number of bits increased by a repetition. An interleaving section 104 performs rearrangement of data whose the number of bits is increased. A second repetition section 105 increases the number of bits of rearranged data about remaining the number of bits increased by the repetition.
